Broken, swollen, bleeding: how to deal with head and neck emergencies

In a dedicated Special Focus session at ECR 2018 today, three experts will illustrate how to deal with head and neck emergencies.

In today’s session entitled: Head and neck emergencies, Dr Elizabeth Loney will address preoperative planning to reconstruct facial bones, muscles and soft tissue. She will discuss craniofacial injuries, maxillo-facial fractures, evaluating craniofacial injuries, and finishing with traumatic lesions to facial fractures, touching briefly on the next step is to evaluate whether the midface from the skull base. Excluding or including isolated fractures involving the palate, the maxillary sinus, and the mandible.

"When confronted with a complex trauma CT scan, it is essential to have a ‘system’,” Loney said. “It is bleeding, it’s infective, it’s a pattern injury,” she said.

The Le Fort V3 fracture and the palate, according to Dr. Loney, is crucial to have a ‘system’.

“Bear in mind the clinical context, he said. “It is so easy to produce long, complex reports which are essentially lots of facts lines, rather than a concise helpful report.

It is bleeding, it is infective, it is a pattern injury,” she said.
